NexaLiving

PRIVATE NEIGHBOURHOOD COMMUNITY & SOCIETY MANAGEMENT

Team Project Guide

Simple guide to the project vision, real-life problems, proposed solutions, core features, user roles, and visual design theme.

LIGHT THEME	DARK THEME
Soft Cloud — #F8FAFC White Surface — #FFFFFF Royal Violet — #6D28D9 Light Violet — #8B5CF6 Emerald — #10B981	Midnight Navy — #0B1020 Deep Card — #151C2F Elevated Slate — #1E293B Lavender Accent — #A78BFA Violet Button — #7C3AED

Brand: Royal Violet + Emerald | Font: Inter | AI: Not included

Project Leader: Syed Waleed Ali
Team: Muhammad Anas, Maliku Abdul Moiz, Abeer Raees

Purpose: help the whole team understand what NexaLiving is before screens, database, backend, and task planning begin.

1. What is NexaLiving?

NexaLiving is a private digital community for a society, block, or neighbourhood. It helps residents find local information, connect with trusted people, share useful resources, and send requests to society management.

Example: Residents of Gulshan Block 7 can view official announcements, find a tutor or plumber, see rental listings, request a community hall, or ask a neighbour to lend a drill machine.

The name is a creative brand idea: “Nexa” suggests next-generation connection, while “Living” refers to everyday life and community. This is a brand interpretation, not a formal dictionary definition.

2. Main problems and proposed solutions

Problem	NexaLiving solution
Important messages get lost in chat groups.	A dedicated announcements feed; only authorised admins publish official notices.
Residents do not know who nearby can help.	A private community directory and Need → Match requests.
Finding local workers is difficult.	Category-based local services: plumber, electrician, carpenter, AC technician, etc.
Parents struggle to find nearby tutors.	Tutor profiles searchable by subject, grade, location and availability.
Booking a society hall takes repeated calls.	View spaces and available time slots, submit a request, and track admin approval.
Useful items sit unused while neighbours need them.	Give Away and borrow/lend listings with owner approval.
Residents cannot easily find local rentals.	Rental listings with rent, photos, availability and contact details.
People miss local offers and community updates.	Local deals and community announcements in dedicated sections.
Urgent updates may not reach everyone.	Authorised emergency alerts and relevant notifications.
Families needing support may be exposed publicly.	Restricted, privacy-aware assistance requests handled by authorised reviewers.
Residents with similar routes do not coordinate.	Optional carpool listings with destination, time and seat details.
Nearby doctor information is scattered.	A local doctor directory with speciality and contact details; not a diagnosis service.

3. Three highlighted core features

A. Tutor–Student Connect

Problem: Parents need a suitable tutor; tutors need to reach nearby students.
Flow: Tutor creates a profile → adds subjects, grades, availability and fee range → parent searches and filters → parent views profile → sends a request or contacts the tutor.
Trust: A “verified” label should only be used after a real verification process.

B. Event Space Booking

Problem: Residents do not know which society spaces are free or how to reserve them.
Flow: Admin adds spaces and time slots → resident checks availability → submits event details, date, time, guest count and chosen space → admin approves/rejects → resident sees status.
Important: Backend must re-check availability during approval to reduce double-booking risk.

C. Need → Match

Problem: A resident may need an item or help temporarily but not know which neighbour can provide it.
Flow: Resident posts item/service, date/time and duration → system filters matching listings in the same community → resident sends a request → owner accepts/rejects → both coordinate handover.
Example: “I need a drill machine for two hours this evening.” The app may show three matching listings if three suitable, available listings exist.

These matching results use normal filters and database queries. AI is not part of the project.

4. Other proposed features

Feature	Simple purpose
House for Rent	Browse and publish local rental properties.
Local Services	Find nearby service providers by category.
Carpool	Coordinate rides for similar routes and times.
Nearby Doctors	Find local doctor profiles and contact details.
Local Deals	Show promotions from local shops.
Emergency Alerts	Send urgent community notices through authorised admins.
Give Away	Offer useful items for free to other residents.
Verified Family Assistance	Manage support requests with privacy and authorised review.
Announcements	Share official society updates.

5. Users and permissions

Role	What they can do (proposed)
Resident	View community content, create permitted requests/listings, book spaces and manage their profile.
Society Admin	Publish official notices, manage event spaces/bookings, review reports and moderate content.
Tutor / Service Provider	Maintain a profile, list services or subjects, respond to relevant requests. May also be a resident.
Property Owner	Create and manage rental listings. May also be a resident.

6. Safety, privacy and reliability

• Private communities: users should only access societies they are authorised to join.

• Verification: define who checks residents, tutors, property listings and assistance requests before showing a verified badge.

• Permissions: residents should not be able to publish official announcements or approve their own event bookings.

• Booking conflicts: the backend must validate dates and time slots, not rely only on what the screen displays.

• Personal information: avoid exposing home addresses, phone numbers or family assistance details publicly.

• Reporting and moderation: provide a way to report suspicious listings or inappropriate content.

7. Design system (selected preview)

Token	Light theme	Dark theme
Theme name	Soft Cloud	Midnight Navy
App background	#F8FAFC	#0B1020
Card background	#FFFFFF	#151C2E
Raised surface	#FFFFFF	#1E293B
Primary brand	#6D28D9 — Royal Violet	#A78BFA — Lavender Violet
Primary light	#8B5CF6 — Soft Violet	#7C3AED — Deep Violet button
Secondary	#10B981 — Emerald	#34D399 — Bright Emerald
Main text	#111827	#F8FAFC
Secondary text	#64748B	#A1A1AA
Border	#E2E8F0	#334155
Success / Warning / Error	#059669 / #D97706 / #DC2626	#34D399 / #FBBF24 / #F87171

Font: Inter. Suggested styles: Display 32/Bold 700; Screen title 26/Bold 700; Section heading 20/Semibold 600; card title 16/Semibold 600; body 14–16/Regular 400; caption 12/Regular 400; button 16/Semibold 600.

Components: 12 px button radius; 16 px card radius; 48–52 px primary button height; spacing scale 4, 8, 12, 16, 24, 32 px. Theme control should offer Light, Dark and System Default.

8. High-level technical concept

Layer	Simple meaning	Examples
React Native app	Screens and interactions the user sees.	Login, Home, Tutor, Booking, Need → Match, Settings
Backend/API	Rules and operations behind the app.	Approvals, permissions, booking conflict checks, matching filters
Database	Stores the app's information.	Users, societies, memberships, listings, bookings, requests
Authentication	Confirms who the user is.	Sign up, login, logout, password reset
Authorization	Checks what each user may do.	Admin-only announcements, resident-only permitted actions
Notifications	Alerts relevant users about updates.	Booking status, accepted request, urgent announcement

9. Suggested MVP (first usable version)

To keep the project achievable for a four-person student team, discuss building a smaller working version first. The list below is a proposal, not a final decision.

- Authentication and resident profiles.
- Society membership and basic admin/resident permissions.
- Announcements feed.
- Tutor–Student Connect basic profiles and search.
- Event Space Booking with admin approval and conflict checks.
- Need → Match for borrowing/lending items.
- Light/Dark/System theme setting.

Possible later features: rentals, carpool, local deals, doctor directory, Give Away, family assistance, richer service listings, ratings and advanced notifications. Final prioritisation should be agreed by the team and teacher.

10. Suggested discussion and work sequence

Step	Team decision
1. Confirm scope	Agree which features belong in the first version and which can wait.
2. Confirm roles	Decide resident/admin/provider permissions and society membership checks.
3. Map screens	List screens and draw user flows before implementation.
4. Approve UI kit	Use the same colors, Inter styles, spacing, buttons and cards across screens.
5. Design data model	Agree the key collections/tables and relationships.
6. Plan API and security	Define endpoints, validation and permission rules.
7. Split team tasks	Assign screens/modules, agree GitHub branches and review process.
8. Build and test	Implement in small increments and test main user flows.

Working rule: all features and workflows in this guide are proposed requirements until the project leader and team confirm them. No AI feature is planned.
